

**AIR BAFFLE FOR MANAGING COOLING AIR RE-CIRCULATION IN AN
ELECTRONIC SYSTEM**

Christopher G. Malone
Glenn C. Simon

ABSTRACT

An airflow management apparatus is used in an electronic system and includes a flexible air baffle that mounts on a chassis of an electronic device in an arrangement and obstructs air flow between an air inlet vent and an air exhaust vent of the electronic device. The flexible air baffle has a thickness that extends across a gap to contact an adjacent vertically-stacked electronic device.
